#### **EXERCISE-9**

### **Sub queries**

# **Objectives**

After completing this lesson, you should be able to do the following:

- Define subqueries
- Describe the types of problems that subqueries can solve
- List the types of subqueries
- Write single-row and multiple-row subqueries

### Using a Subquery to Solve a Problem

Who has a salary greater than Abel's?

# Main query:

Whichemployees have salaries greater than Abel's salary?

# **Subquery:**

WhatisAbel's salary?

### **Subquery Syntax**

SELECT select list FROM table WHERE expr operator (SELECT select list FROM table );

- The subquery (inner query) executes once before the main query (outer query).
- The result of the subquery is used by the main query.

A subquery is a SELECT statement that is embedded in a clause of another SELECT statement. You can build powerful statements out of simple ones by using subqueries. They can be very useful when you need to select rows from a table with a condition that depends on the data in the table itself.

You can place the subquery in a number of SQL clauses, including the following:

- WHERE clause
- HAVING clause
- FROM clause

#### In the syntax:

operatorincludes a comparison condition such as >, =, or IN

**Note:** Comparison conditions fall into two classes: single-row operators (>, =, >=, <, <>, <=) and multiple-row operators (IN, ANY, ALL). statement. The subquery

generally executes first, and its output is used to complete the query condition for the main (or outer) query

#### Using a Subquery

SELECT last\_name FROM employees WHERE salary > (SELECT salary FROM employees WHERE last\_name = 'Abel');

Sarvesh S - 240701479 - DBMS RECORD inner query and uses this result to display all the employees who earn more than this amount. **Guidelines for Using Subqueries** 

• Enclose subqueries in parentheses. • Place subqueries on the right side of the comparison condition. • The ORDER BY clause in the subquery is not needed unless you are performing Top-N analysis. • Use single-row operators with single-row subqueries, and use multiple-row operators with multiple-row subqueries.

# **Types of Subqueries**

- Single-row subqueries: Queries that return only one row from the inner SELECT statement.
- Multiple-row subqueries: Queries that return more than one row from the inner SELECT statement.

**Single-Row Subqueries** 

- Return only one row
- Use single-row comparison operators

# **Example**

Display the employees whose job ID is the same as that of employee 141: SELECT last\_name, job\_id FROM employees WHERE job\_id = (SELECT job\_id FROM employees

WHERE employee id = 141);

Displays employees whose job ID is the same as that of employee 141 and whose salary is greater than that of employee 143.

SELECT last\_name, job\_id, salary FROM employeesWHERE job\_id =(SELECT job\_id FROM employees WHERE employee\_id = 141) AND salary > (SELECT salary FROM employees WHERE employee\_id = 143);

**Using Group Functions in a Subquery** 

Displays the employee last name, job ID, and salary of all employees whose salary is equal to the minimum salary. The MIN group function returns a single value (2500) to the outer query. SELECT last\_name, job\_id, salary FROM employees WHERE salary = (SELECT MIN(salary) FROM employees);

The HAVING Clause with Subqueries

Sarvesh S - 240701479 - DBMS RECORD

• The Oracle server returns results into the HAVING clause of the main query. Displays all the departments that have a minimum salary greater than that of department 50. SELECT department\_id, MIN(salary) FROM employees GROUP BY department\_id HAVING MIN(salary) > (SELECT MIN(salary) FROM employees WHERE department id = 50);

Example Find the job with the lowest average salary.

SELECT job\_id, AVG(salary) FROM employees GROUP BY job\_id HAVING AVG(salary) = (SELECT MIN(AVG(salary)) FROM employees GROUP BY job\_id);

### What Is Wrong in this Statements?

SELECT employee\_id, last\_name FROM employees WHERE salary =(SELECT MIN(salary) FROM employees GROUP BY department\_id); Will This Statement Return Rows? SELECT last\_name, job\_id FROM employees WHERE job\_id =(SELECT job\_id FROM employees WHERE last\_name = 'Haas');

**Multiple-Row Subqueries** 

• Return more than one row

• Use multiple-row comparison operators

# **Example**

Find the employees who earn the same salary as the minimum salary for each department. SELECT last\_name, salary, department\_id FROM employees WHERE salary IN (SELECT MIN(salary)

FROM employees GROUP BY department id);

Using the ANY Operator in Multiple-Row Subqueries

SELECT employee\_id, last\_name, job\_id, salary FROM employees WHERE salary < ANY (SELECT salary FROM employees WHERE job\_id = 'IT\_PROG') AND job\_id <> 'IT\_PROG';

Sarvesh S - 240701479 - DBMS RECORD

programmer. The maximum salary that a programmer earns is \$9,000. < ANY means less than the maximum. >ANY means more than the minimum. =ANY is equivalent to IN.

# Using the ALL Operator in Multiple-Row Subqueries

\_\_\_\_

SELECT employee\_id, last\_name, job\_id, salary

FROM employees

WHERE salary < ALL (SELECT salary FROM employees WHERE job\_id = 'IT\_PROG') AND job id <> 'IT PROG';

Displays employees whose salary is less than the salary of all employees with a job ID of IT PROG and whose job is not IT PROG.

ALL means more than the maximum, and <ALL means less than the minimum.

The NOT operator can be used with IN, ANY, and ALL operators.

# **Null Values in a Subquery**

SELECT emp.last name FROM employees emp

WHERE emp.employee id NOT IN (SELECT mgr.manager id FROM employees mgr);

Notice that the null value as part of the results set of a subquery is not a problem if you use the IN operator. The IN operator is equivalent to =ANY. For example, to display the employees who have subordinates, use the following SQL statement:

SELECT emp.last name

FROM employees emp

WHERE emp.employee id IN (SELECT mgr.manager id FROM employees mgr);

Display all employees who do not have any subordinates:

SELECT last name FROM employees

WHERE employee\_id NOT IN (SELECT manager\_id FROM employees WHERE manager\_id IS NOT NULL);

Find the Solution for the following:

1. The HR department needs a query that prompts the user for an employee last name. The query then displays the last name and hire date of any employee in the same department as the employee whose name they supply (excluding that employee). For example, if the user enters Zlotkey, find all employees who work with Zlotkey (excluding Zlotkey).

SELECT last_name, hire_date	
FROM employees	☐ Download ▼ Execution time: 0.143 second
WHERE department_id=(SELECT department_id FROM employees	LAST_NAME HIRE_DATE
<pre>WHERE last_name = 'Zlotkey')</pre>	No items to display.
<pre>AND last_name &lt;&gt; 'Zlotkey';</pre>	

2. Create a report that displays the employee number, last name, and salary of all employees who earn more than the average salary. Sort the results in order of ascending salary.

```
SELECT employee_id, last_name, salary
FROM employees
WHERE salary > (SELECT AVG(salary)
FROM employees)
ORDER BY salary ASC;

Download ▼ Execution time: 0.006 seconds

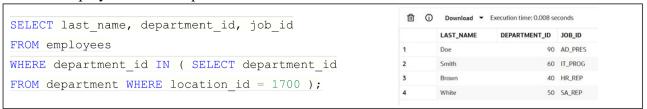

EMPLOYEE_ID LAST_NAME SALARY

1 1002 Smith 8000
2 1001 Doe 12000
```

3. Write a query that displays the employee number and last name of all employees who work in a department with any employee whose last name contains a u.

4. The HR department needs a report that displays the last name, department number, and job ID of all employees whose department location ID is 1700.

5. Create a report for HR that displays the last name and salary of every employee who reports to King.

```
SELECT last_name, salary

FROM employees

WHERE manager_id = ( ELECT employee_id

FROM employees WHERE last_name = 'King' );

Comparison of the property of t
```

6. Create a report for HR that displays the department number, last name, and job ID for every employee in the Executive department.

```
SELECT department_id, last_name, job_id

FROM employees

WHERE department_id IN ( SELECT department_id

FROM department WHERE dept_name = 'Executive');

Download ▼ Execution time: 0.006 seconds

DEPARTMENT_ID LAST_NAME JOB_ID

No items to display.
```

7. Modify the query 3todisplay the employee number, last name, and salary of all employees who earn more than the average salary and who work in a department with any employee whose last name contains a u.

<pre>SELECT employee_id, last_name, salary</pre>						
FROM employees	面	(i)	Downlo	oad 🔻	Execution	time: 0.005 seconds
WHERE salary $>$ (SELECT AVG(salary) FROM employees)	EMPLO'	EMPLOYEE_ID LAST_NAME		ME	SALARY	
AND department_id IN ( SELECT department_id	No items	s to displa	lay.			
FROM employees WHERE last_name LIKE '%u%');
